ABSTRACT

Each Kaushal [1] can hold only one molecule. Medicines disintegrate into molecules and these molecules are absorbed by blood vessels through villi and microvilli present in our small intestine [2]. Relationship between target Kaushal and medicine Kaushal through sub-consciousness has been discussed.

Key words:

Kaushal; molecules; blood vessel; villi; microvilli; sub-consciousness

INTRODUCTION

Our body is in constant motion and hence it must be making a web of gravitational waves around itself and this web is a combination of Kaushal [1]. Hypothesis one, Each Kaushal can hold only one molecule. Medicines which we take does not know where the target is, they search the whole body for the target Kaushal.

Analysis of hypothesis

Humans are the creation of earth. So, the rules that are applicable on earth must be applicable on us too. The earth is tilted at 23.4° with respect to the sun, to make it simple only earth's rotation in a certain plane is taken into consideration, it must be radiating gravitational waves at this angle while the effective surrounding gravitational waves are coming from the sun at an angle of 0°. A web of infinite and increasing quadrilaterals will be created in between them which can be approximated as a parallelogram over a short distance. This one parallelogram is one Kaushal [1].

Hence this Kaushal must be a part of humans also, from now on we will call them static Kaushal. Humans are also dynamic and must be making their own Kaushal too, from now on we will call them dynamic Kaushal. Each Kaushal can hold only one molecule.

Static and dynamic Kaushal

Static Kaushal is the one due to which our body and genes exists. Dynamic Kaushal is the one due to which our consciousness exists. Kaushal is the fifth element of life also known as empty space or nothingness.

Medicine and targets

When we take any medicine, it breaks into molecules and these molecules occupies dynamic Kaushal of the body. We take medicines to remove the shortcomings which hinders the normal workflow of the body. When these shortcomings occur, the respective chemical is released by the body which occupy static Kaushal of the body. Blood flow help the medicine molecules to travel from one dynamic Kaushal to another in search of the respective chemical in static Kaushal. Where they meet medicine shows its effects.

Role of sub-consciousness

Our sub-conscious mind becomes highly active when we sleep. This is because our dynamic Kaushal comes in resonance with the static Kaushal and hence medicine molecules are able to identify the target molecules with high efficiency. That is why medicines work best before sleeping.

CONCLUSION

Each Kaushal can hold only one molecule at a time. Static and dynamic Kaushal are the fifth element of life, this is why it is not a good idea to go to mars as our static Kaushal will be affected whose results will be tragic. Sub-consciousness plays an important role in helping medicines to identify their targets.
